WHAT DRIVES INTEREST RATES?

Mortgage rates are affected by numerous factors. Many other influences can also trigger rates to rise and fall.

1 INFLATION

Mortgage lenders are very sensitive to inflation. When inflation rates go higher, interest rates often rise as well.

2 ECONOMY

When GDP and employment rise, it's a sign of a growing economy, meaning greater demand for real estate. When demand rises, so do interest rates as there is more demand than money to lend.

3 FEDERAL RESERVE

While the Fed doesn't directly impact rates, when the federal fund's rates are raised or lowered it affects many markets that can ultimately impact rates.

4 INVESTORS

Bonds are typically a safe investment so when the economic outlook is poor, they flood to the bond market. When there are more investors in bonds, the bond yield rises, and mortgage rates tend to rise as well.

WHY INTEREST RATES RISE

- Investors will dump more money into stocks than bonds
- A high number of bonds are auctioned, lowering bond prices and raising interest rates
- When wages and employment are up, consumer spending rises, affecting GDP and the economy
- When the stock market moves higher, bond PRICES drop, driving rates higher

WHY INTEREST RATES FALL

- Assumption that the Fed will continue to keep short-term rates low
- A slow housing market and lower demand for mortgages
- Declining economy - lower employment levels and lower wages
- The stock market moves to very low levels, driving bond prices higher and rates lower
